

Floaters for dredge pipeline

Floaters are an essential component of dredging pipelines, especially for those used in the dredging industry. These pipeline floaters are designed to help support the pipeline and keep it afloat, which is important for maintaining the pipeline's stability and preventing damage to the surrounding environment.

Our floaters are made from rotomoulded polyethylene, which is a durable and reliable material that can withstand harsh marine environments. They are available in different sizes to suit the specific needs of different dredging operations and can be used with both steel and [HDPE pipelines](#).

When selecting floaters for your dredging pipeline, it's important to consider the weight of the pipeline, the type of sediment being pumped, and the depth of the water. These factors will help determine the appropriate size and quantity of floaters needed to ensure the pipeline remains stable and secure.

Floaters for dredging pipeline

Our floaters are made in Europe with high-quality materials and affordable prices, which can help reduce the overall cost of dredging operations. By investing in high-quality floaters, you can improve the safety and efficiency of your dredging operations and ensure that your pipeline remains secure and stable, even in challenging conditions.

Information for transporting each type of floaters:

TYPE	20FT	40FT	PLACEMENT OF THE FLOATERS
XXS			
XS	224	480	Width
S	126	270	Width
M	91	195	Width
L	36	51	Length
XL	30	66	Length
XXL	18	36	Length
