

Jet pump barge

Looking for a jet pump to lose your sand, gravel, silt or clays? We supply a water jet pump on a small barge with diesel engine.

The water jet pump has a water flow of 350 M3/h and 8 bar pressure, is a powerful and efficient tool for dredging operations. The diesel engine provides the power needed to generate the high-pressure water jet, and the pump itself is designed to withstand the harsh conditions of dredging.

When using a jet pump for dredging, it's important to consider factors such as the type and size of the material being dredged, the depth of the water, and the distance between the dredging site and the barge. Proper operation and maintenance of the jet pump is also important to ensure maximum efficiency and safety.
