

Used dredge pump 14/12

{gallery}warman-pump-14-12{/gallery}

This used dredge pump is a type of centrifugal pump with a 14 inch (355.6 mm) suction inlet and a discharge outlet of various sizes. It is designed to handle large volumes of fluid, slurries, and solids, making it ideal for use in dredging applications.

Dredging is the process of excavating and removing sediment and debris from the bottom of bodies of water, such as rivers, lakes, and harbors, to maintain navigation channels, deepen waterways, or reclaim land. The Warman 14 inch dredge pump is used in dredging operations to move large volumes of water, sand, gravel, and other materials from the dredging site to a disposal area, such as a barge, dump site, or reclamation area.

In addition to dredging, this pre-owned dredge pump can also be used in other heavy-duty applications, such as mining, mineral processing, and construction, where large volumes of abrasive or corrosive fluids need to be pumped over long distances.

Used dredge pump 14/12

Refurbishing this dredge pump can be a cost-effective way to acquire a high-quality pump at a cheaper price compared to buying a brand new one.
